

****Patient: Miss. Durga****

****Age/Sex: 15 years/Female****

****Date of Report: 31-07-2025****

****Referred by: Dr. Anand****

****Summary of Key Findings and Abnormalities:****

1. **Complete Blood Count (CBC):**

- ****Hemoglobin:**** 12.9 gm/dl (Normal range: 12 - 16 gm/dl) - Normal.
- ****Total WBC:**** 7900 cells/cumm (Normal range: 4000 - 11000 cells/cumm) - Normal.
- ****Differential Count:**** All within normal limits:
 - Neutrophils: 67% (Normal range: 40 - 70%)
 - Lymphocytes: 28% (Normal range: 20 - 40%)
 - Eosinophils: 2% (Normal range: 0 - 8%)
 - Monocytes: 3% (Normal range: 0 - 10%)
 - Basophils: 0% (Normal range: 0 - 1%)
- ****Platelet Count:**** 2.92 Lakhs/cumm (Normal range: 1.5 - 4.5 Lakhs/cumm) - Normal.
- ****RBC:**** 4.79 mill/cumm (Normal range: 3.5 - 5.5 mill/cumm) - Normal.
- ****PCV (Packed Cell Volume):**** 37.5% (Normal range: 36 - 48%) - Normal.
- ****MCV (Mean Corpuscular Volume):**** 78.3 fl (Normal range: 80 - 99 fl) - Slightly below normal, suggesting potential microcytosis.
- ****MCH (Mean Corpuscular Hemoglobin):**** 27.0 pg (Normal range: 26 - 32 pg) - Normal.
- ****MCHC (Mean Corpuscular Hemoglobin Concentration):**** 34.5% (Normal range: 32 - 36%) - Normal.

2. **Dengue Virus Rapid Test:**

- **NS1 Antigen:** Negative
- **Dengue IgG:** Negative
- **Dengue IgM:** Negative
- **Interpretation:** No current or recent infection with Dengue virus.

3. **Serology - Widal Test:**

- **Salmonella Typhi "O":** 1:160 - Indicates a possible current infection.
- **Salmonella Typhi "H":** 1:80
- **S. Paratyphi "AH":** 1:80
- **S. Paratyphi "BH":** 1:40
- **Interpretation:** The titers suggest a possible typhoid fever infection, particularly with the elevated "O" antigen titer.

4. **Urine Routine:**

- **Albumin:** Nil - Normal.
- **Sugar:** Nil - Normal.
- **WBC in Urine:** 4-5 /hpf (Normal range: 0 - 4 /hpf) - Slightly elevated, may suggest a mild urinary tract infection.
- **Epithelial Cells:** 3-4 /hpf (Normal range: 0 - 4 /hpf) - Normal.
- **RBC in Urine:** Nil - Normal.

Conclusion:

The patient's CBC is largely within normal limits except for a slightly low MCV. The Widal test results suggest a potential typhoid fever infection. The urine analysis indicates a possible mild urinary tract infection. Negative results for Dengue virus indicate no infection of this type. Further clinical correlation and possibly additional tests are recommended to confirm typhoid fever and address the

urinary findings.
