

****Patient: Mrs. Shabana, 46 years old, Female****

****Laboratory Report Summary:****

1. ****Total Triiodothyronine (T3)**:** 0.69 nmol/L (Normal Range: 0.6 - 1.8 nmol/L)
 - T3 levels are within the normal range, but on the lower end.

2. ****Total Thyroxine (T4)**:** 6.64 nmol/L (Normal Range: 4.5 - 12.6 nmol/L)
 - T4 levels are also within the normal range, but closer to the lower boundary.

3. ****Thyroid Stimulating Hormone (TSH)**:** 2.55 μ IU/mL (Normal Range: 0.35 - 5.5 μ IU/mL)
 - TSH levels are normal and well within the mid-range.

****Key Findings:****

- The thyroid function tests show that Mrs. Shabana's thyroid hormone levels (T3 and T4) are within the normal range but tend towards the lower end. Her TSH level is normal, suggesting adequate thyroid function but may warrant monitoring to ensure that the lower T3 and T4 levels do not indicate an early stage of hypothyroidism.

****Recommendations:****

- It may be beneficial to monitor Mrs. Shabana's thyroid function periodically to detect any changes that might suggest a trend towards hypothyroidism, given the lower end values of T3 and T4.
- Clinical correlation with symptoms and possibly a repeat of thyroid function tests in the future could be considered to ensure continued normal thyroid function.

****Note:****

- The laboratory emphasizes that results can vary and should be interpreted by the treating physician, taking into account clinical correlation and possible inter-laboratory variations.
